

# **Reactor Physics and Safety Aspects of Fast Neutron Reactors with Associated Closed Fuel Cycle**

**Baldev Raj and P.Mohanakrishnan  
Indira Gandhi Centre for Atomic Research  
Kalpakkam, TN, 603102, INDIA**

# CONTENTS

- **India's commitment to FBR technology**
- **Prototype Fast Breeder Reactor and Fuel Cycle**
  - In-core fuel management**
  - Multi-recycle**
- **Sustainability of Metallic Fuelled FBR**
  - Breeding ratios and other parameters**
  - ULOF accident and safety**
  - Projected power scenario in India**

# CONTENTS

- **Prospects of MA Incineration**
  - MA fuelled FBR design
  - Effect of MA cross-section uncertainties
- **Thorium Utilisation**
- **Valuable Fission Products in FBR cycle**
- **Cost Reduction of FBR Fuel Cycle**
  - High fuel burnups
  - Co-located fuel cycle facilities

# COMMITMENT TO FBR TECHNOLOGY

- **Present PHWR once through fuel cycle potential - 10 GWe for 40 y – First stage**
- **Present emphasis on exploration of new U deposits**
- **14 PHWR under operation**
- **Import of U under IAEA safeguards**
- **Reprocessed Pu from PHWR cycle in closed FBR cycle – 1000 GWe for 50 y and U-233 breeding from thorium - Second stage**
- **Th-U breeders fast and thermal – Third stage**

# **PFBR (500 MWe) UNDER CONSTRUCTION**

- **Power – 1250 MWt**
- **Fuel - MOX**
- **Pu enrichments (core-1/core-2) - (21 %/ 28 %)**
- **Coolant circuit – pool type**
- **Number of primary pumps - 2**
- **Number of intermediate heat exchangers – 4**
- **Peak heat rating – 450 w/cm**
- **Refuelling interval – 180 full power days**
- **Core fraction replaced – one third**
- **Peak burnup – 100 GWd/t**
- **Reactor life time – 40 y**

| SYMBOL | TYPE OF SUBASSEMBLY                | No.  |
|--------|------------------------------------|------|
| ◆      | FUEL (INNER)                       | 85   |
| ◆      | FUEL (OUTER)                       | 96   |
| ◆      | CONTROL AND SAFETY ROD             | 9    |
| ◆      | DIVERSE SAFETY ROD                 | 3    |
| ◆      | BLANKET                            | 120  |
| ◆      | STEEL REFLECTOR                    | 138  |
| ◆      | B <sub>2</sub> C SHIELDING (INNER) | 125  |
| ◆      | STORAGE LOCATION                   | 156  |
| ◆      | STEEL SHIELDING                    | 609  |
| ◆      | B <sub>2</sub> C SHIELDING (OUTER) | 417  |
|        | TOTAL SUBASSEMBLIES                | 1758 |

# PFBR CORE

# **PFBR SAFETY REVIEW**

- **Initial review of design by internal safety committee of IGCAR**
- **Project design safety committee of AERB**  
**Basis for review – AERB codes and guides**  
**- IAEA codes and guides**
- **Being first of its kind, comprehensive and systematic review of separate chapters of Preliminary Safety Analysis Report by separate expert groups**
- **Emphasis on**
  - (a) Test results from other fast reactors**
  - (b) Generic problems in other fast reactors**
  - (c) Efficacy of improvements tested**

# IN-CORE FUEL MANAGEMENT

- Computer code FARCOT developed
- Validated against FBTR core and international benchmarks

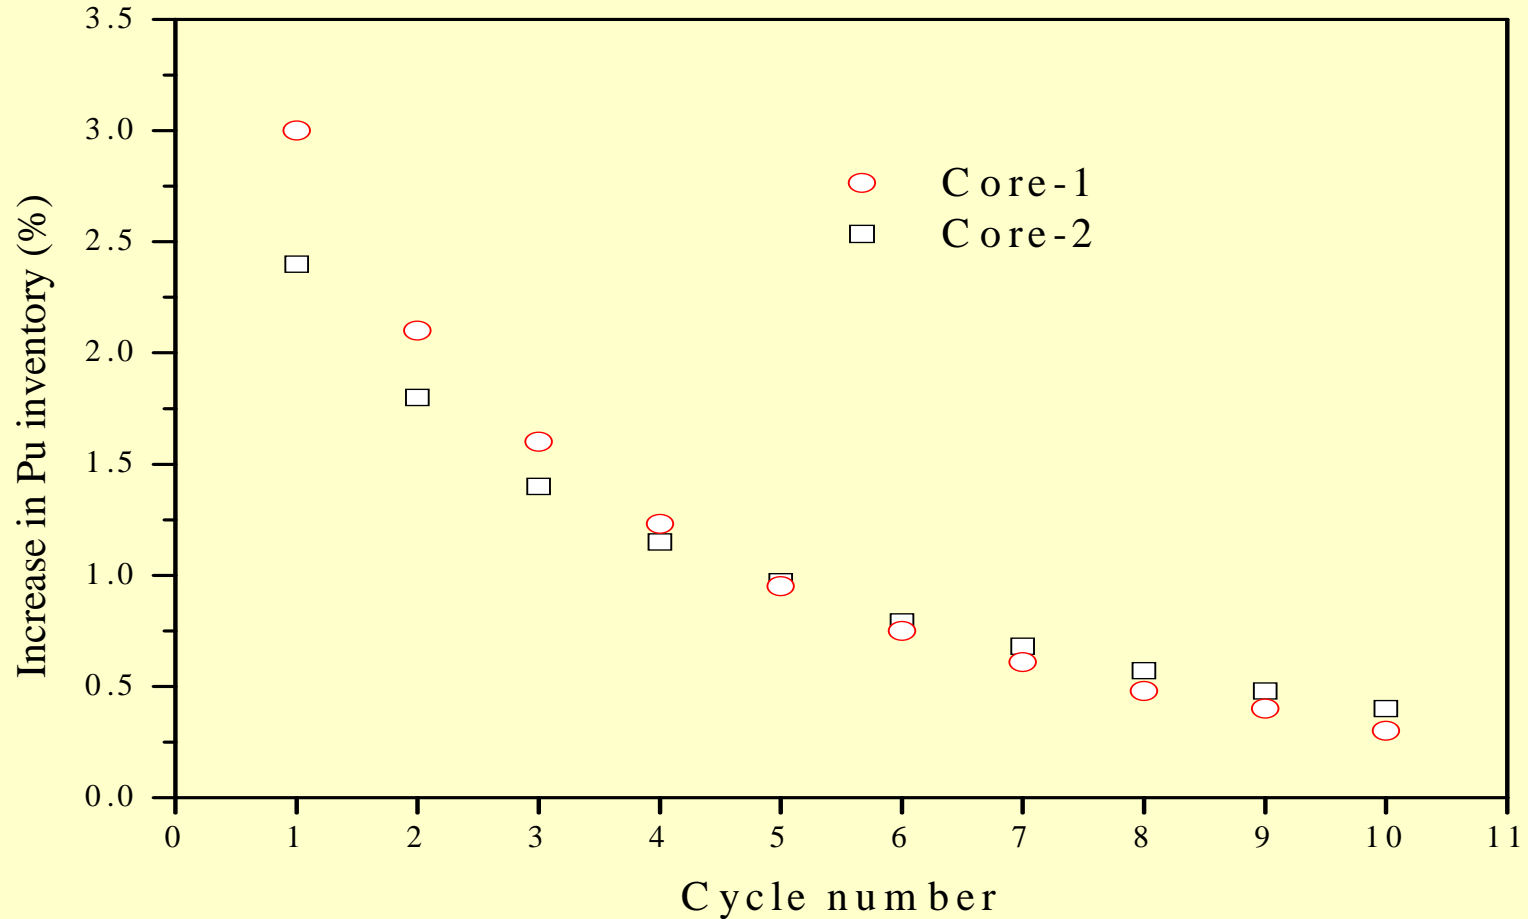

## BN-600 MOX Core Benchmark (IAEA-CRP) (3D Diffusion)

| Parameter                         | ANL      | EU       | JNC      | IGCAR    |
|-----------------------------------|----------|----------|----------|----------|
| keff – BOC                        | 0.99592  | 1.01546  | 1.00713  | 1.00136  |
| - EOC                             | 0.97162  | 0.98914  | 0.98323  | 0.97671  |
| Reactivity loss                   | 0.02511  | 0.02621  | 0.02414  | 0.02520  |
| Doppler constant<br>( $k_D$ ) BOC | -0.00685 | -0.00683 | -0.00646 | -0.00684 |
| EOC                               | -0.00687 | -0.00732 | -0.00703 | -0.00731 |
| Change in $k_D$                   | 0.00002  | 0.00049  | 0.00043  | 0.00047  |

# CLOSED FUEL CYCLE

- In vessel cooling period – 240 d
- Reprocessing period – 240 d
- Fabrication period - 240 d
- Pu-239 reactivity equivalence used to judge quality of Pu after each recycle
- With Pu inventory of 2 cores, 10 fuel cycles (60 refuelling) correspond to 40 y
- Net Pu enrichment change over 10 fuel cycles
  - core-1: 21% to 23.4%,
  - core-2: 28% to 31%

# Pu INVENTORY CHANGE WITH MULTI-RECYCLE

# **SUSTAINING NUCLEAR POWER GROWTH – METAL FUELLED FBR (FBR-M)**

- **Require low fuel Doubling Time**
- **Metal fuel in FBR can provide high fuel breeding**
- **U-Pu-Zr and U-Pu with Zr lined clad**

## **FBR-M (500 MWe)**

| <b>Parameter</b>              | <b>U-Pu-Zr(10%)</b> | <b>U-Pu-Zr(6%)</b> | <b>U-Pu / Zr liner</b> |
|-------------------------------|---------------------|--------------------|------------------------|
| <b>Pu enrichments</b>         | <b>15.4/20.6</b>    | <b>13.6/18.2</b>   | <b>12.7/17.1</b>       |
| <b>Pu inventory (t)</b>       | <b>1.93</b>         | <b>1.97</b>        | <b>2.16</b>            |
| <b>Breeding ratio</b>         | <b>1.24</b>         | <b>1.36</b>        | <b>1.44</b>            |
| <b>Doppler constant (pcm)</b> | <b>-408</b>         | <b>-470</b>        | <b>-501</b>            |
| <b>Na void worth (\$)</b>     | <b>4.6</b>          | <b>5.1</b>         | <b>6.0</b>             |

# **SAFETY ASPECTS OF FBR-M**

- **Compared to MOX core , metal core has lower Doppler constant and significantly higher Na void worth**
- **Concern of reactor safety under unprotected loss of flow accident (ULOFA)**
- **IGCAR study show that despite the high Na void worth, ULOFA of metal core is realtively benign**
- **Na voiding is low and happens only on reactor top – Net reactivity is –ve after 30 minutes**

# SUMMARY RESULTS OF ULOFA

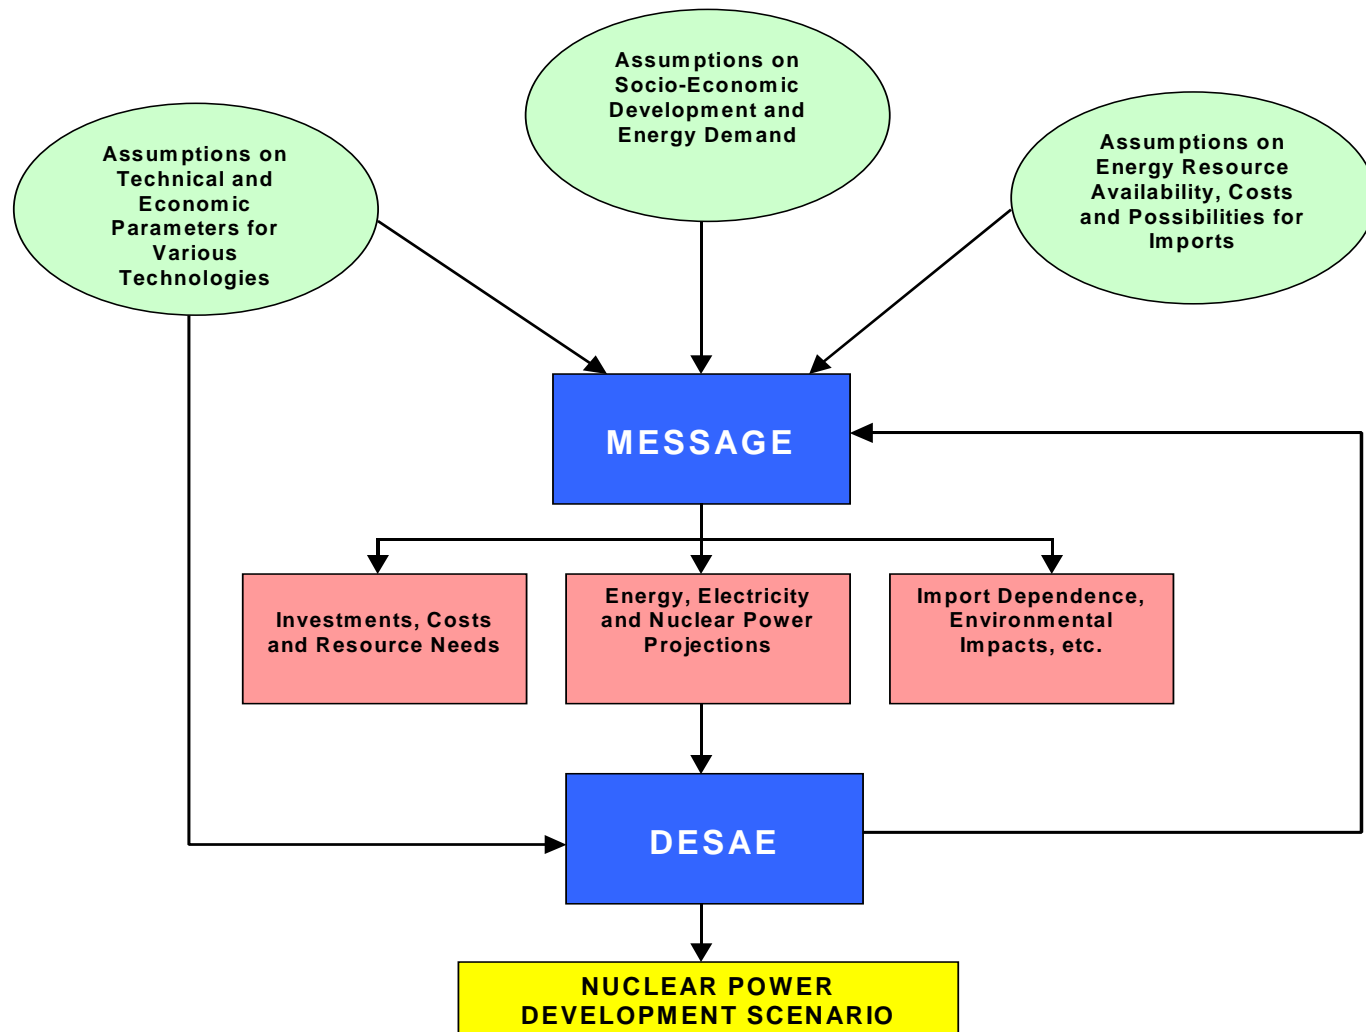

| <b>Conditions after<br/>1800s of ULOFA</b> | <b>U-Pu-<br/>Zr(10%)</b> | <b>U-Pu-<br/>Zr(6%)</b> | <b>MOX<br/>core</b>  |
|--|--------------------------|-------------------------|--|
| <b>Reactor power (MWt)</b>                 | <b>18*</b>               | <b>18*</b>              | <b>Fuel<br/>melted<br/>and core<br/>damaged<br/>at 80s</b> |
| <b>Net reactivity (\$)</b>                 | <b>-0.51</b>             | <b>-0.52</b>            |  |
| <b>Net Na void fraction</b>                | <b>-0.036</b>            | <b>0.036</b>            |  |
| <b>Fuel melting fraction</b>               | <b>0.0</b>               | <b>0.0</b>              |  |

**\*Decay power not added**

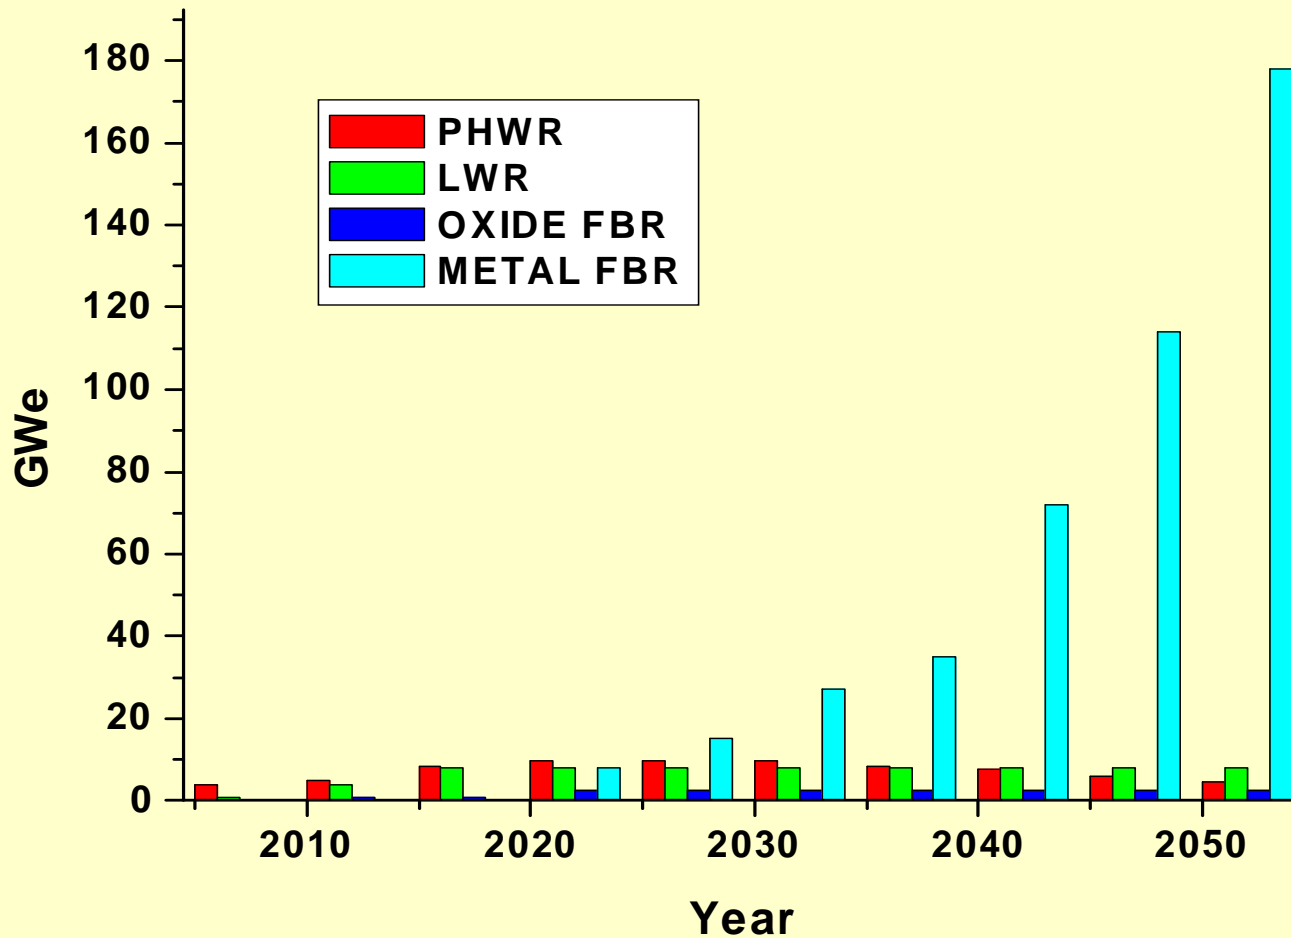

# **POSSIBLE POWER GROWTH SCENARIO WITH FBR-M IN INDIA**

- **IAEA computer codes MESSAGE & DESAE linked under INPRO work**
- **Nuclear material balances and maximum achievable power growth with Pu from PHWR studied**
- **PHWR component peaks at about 2022-2032**
- **Imported LWR component is low**
- **1000 MWe FBR-M with Breeding ratio = 1.6**
- **FBR-M introduced after 2020**
- **FBR-M expected to sustain the power growth**

# NUCLEAR POWER SCENARIO

# A POSSIBLE POWER SCENARIO

# **ADVANTAGES OF THE USE OF FBR FOR MA TRANSMUTATION**

- **Hard neutron spectrum reduces capture to fission ratios compared to thermal**
- **Penalty on core parameters with homogeneous mixing of MA is mild in FBR compared to thermal reactor – (eg. required Pu enrichment reduces)**
- **Existing fuel fabrication facilities handling Pu for FBR can accommodate MA with some strengthening of shields**

# MA PRODUCED IN PHWR

- MA to be partitioned and mixed with FBR core fuel.
- MA produced in PHWR-540 in life time is 112 kg
- Typical composition of MA in discharged fuel ( zero cooling)
  - Np-237 - 88.6 %
  - Am-241 - 5.4 %, Am-242m - 0.045 %, Am-243 - 5.13 %
  - Cm-242 - 0.67 %, Cm-243 - 0.004 %, Cm-244 - 0.15%
- With cooling of few years, Cm-242 decays out
- Pu-238 content is only 0.1 % in PHWR Pu

# DESIGN OF MA BURNER FBR

- PFBR design altered for MA burner
- Depleted  $\text{UO}_2$  radial blanket replaced by  $\text{ThO}_2$
- For thorium utilisation in India (to get fissile U-233), it is not advisable to mix MA in the blankets
- Cycle length – 180 fpd with 1/3 core refueling
- MA loaded in core per cycle – 130 kg
- Transient behaviour is well within acceptable limits (IAEA-CRP)
- Fuel gamma activity is 2 times higher and neutron source is 4 times higher than PFBR fuel

# COMPARISON OF PHYSICS PARAMETERS OF MA BURNER AND PFBR

| <b>Parameter</b>                          | <b>PFBR</b>      | <b>MA<br/>Burner</b> |
|---|------------------|----------------------|
| <b>No. of core sub-assemblies</b>         | <b>85/96</b>     | <b>85/102</b>        |
| <b>PuO<sub>2</sub> enrichment (%)</b>     | <b>21.0/28.0</b> | <b>19.5/27.1</b>     |
| <b>(Pu + MA) inventory (kg)</b>           | <b>1970</b>      | <b>2321</b>          |
| <b>Doppler co-efficient (pcm)</b>         | <b>- 658</b>     | <b>- 610</b>         |
| <b>Delayed neutron fraction (pcm)</b>     | <b>343</b>       | <b>338</b>           |
| <b>Sodium void reactivity of core (%)</b> | <b>1.6</b>       | <b>1.8</b>           |

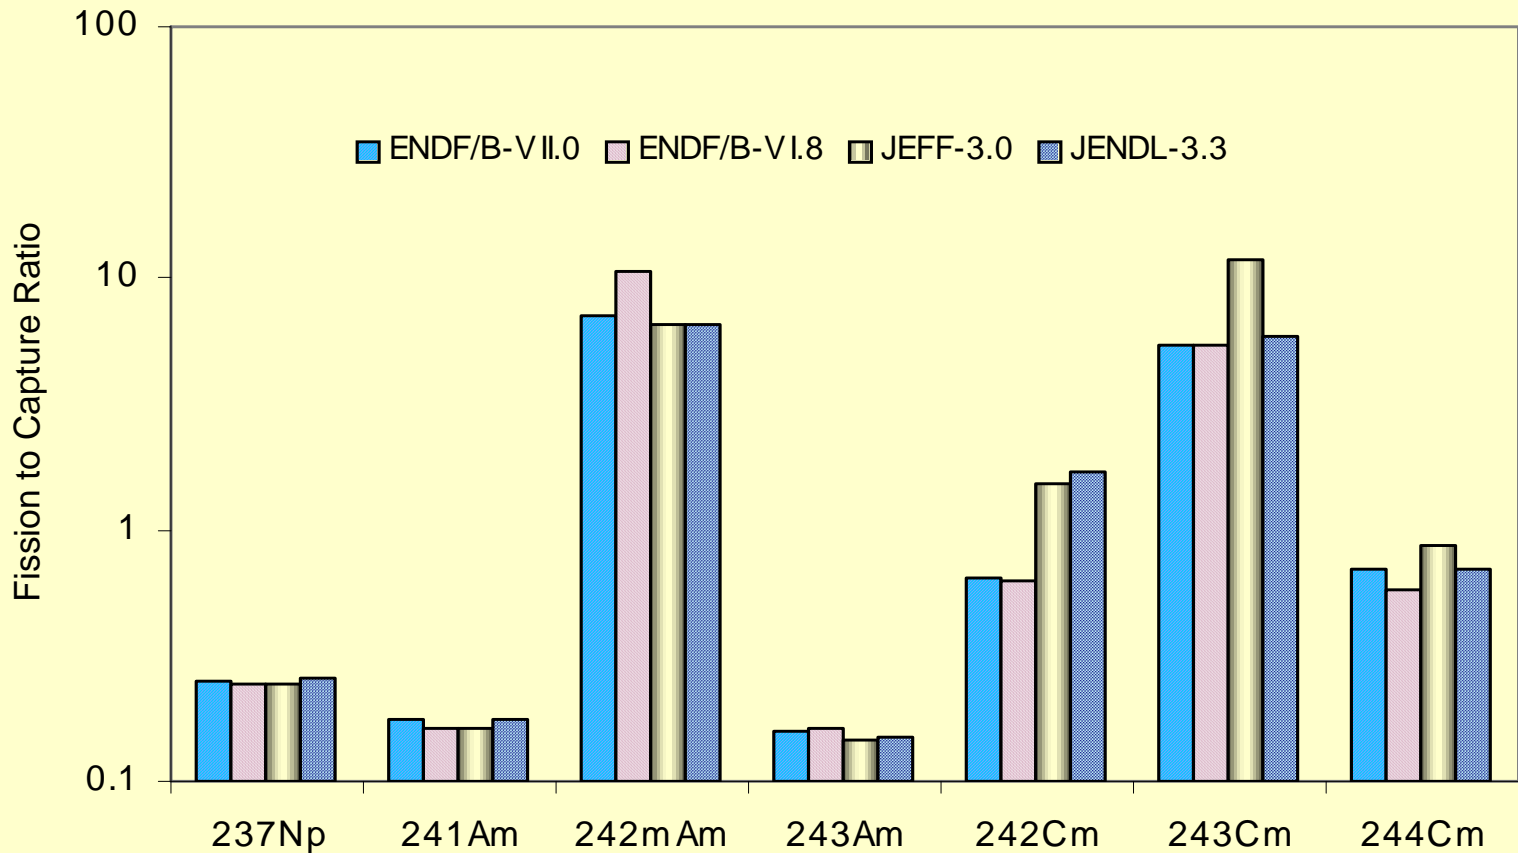

# Fuel And Ma Inventory Change in One Cycle

| <b>Material</b>  | <b>BOC</b>   | <b>EOC</b>     |
|--|--|----------------|
| <b>Pu in core</b>  | <b>1.88 t</b>  | <b>1.85 t</b>  |
| <b>MA in core</b>  | <b>0.368 t</b>                                       | <b>0.336 t</b> |
| <b>MA incineration is 32 kg (8.5 %)</b>                      |  |                |
| <b>Pu in axial blanket</b>                                   | <b>0.079 t</b>                                       | <b>0.127 t</b> |
|  | <b>Pu gain 48 kg</b>                                 |                |
| <b>MA gain in radial and axial blankets</b>                  | <b>Insignificant - 50gm each in radial and axial</b> |                |
| <b>U-233 in radial blanket</b>                               | <b>0.621 t</b>                                       | <b>0.664 t</b> |
|  | <b>U-233 gain 43 kg</b>                              |                |
| <b>ThO<sub>2</sub> in axial blankets produce 31 kg U-233</b> |  |                |

# **EFFECT OF SPREAD OF EVALUATED MA NUCLEAR DATA**

- **MA data used from JENDL 3.3, JEFF 3.0  
ENDF/B-VI.8 and ENDF/B-VII.0**
- **Fuel Doppler constant -  $\pm 5\%$**
- **Na void worth -  $\pm 10\%$**
- **Delayed neutron fraction ( $\beta$ ) -  $\pm 2\%$   
Individual isotope  $\beta$  differences are 10 to 20 %**
- **Reactivity loss in a cycle  $\pm 3\%$**

# COMPARISON OF CAPTURE TO FISSION RATIO

# VALUABLE FISSION PRODUCTS FROM FBR FUEL CYCLE

|                 | 1 GWe for 1 y<br>(75 % capacity) |
|-----------------|----------------------------------|
| Element/Isotope | kg                               |
| Cs (Cs-137)     | 143.7 (44.6)                     |
| Sr (Sr-90)      | 16.8 (10.2)                      |
| Ru              | 108.2                            |
| Rh              | 39.1                             |
| Pd              | 83.0                             |

Rh and Ru become inactive few tens of years after separation

# **COST REDUCTION OF FUEL CYCLE**

## **Multiple units at a given site**

- **Sharing of facilities outside nuclear island**
- **Sharing of fuel handling facilities of two units**
- **Sharing of operation and maintenance**

## **Road map for higher fuel discharge burnups**

- **Aim for 200 GWd/t peak burnup with right choice of structure materials**
- **Radiation damage models and micro-structure characterization of materials**
- **Ferritic martensitic steels and Oxide Dispersion Steels (ODS) are the viable choices**

# REACTOR PHYSICS ASPECTS OF HIGH BURNUP OXIDE CORE

| <b>Parameter</b>                       | <b>PFBR</b>  | <b>Future<br/>Oxide</b> |
|--|--------------|-------------------------|
| <b>Breeding ratio</b>                  | <b>1.05</b>  | <b>1.16</b>             |
| <b>Cycle length</b>                    | <b>180</b>   | <b>270</b>              |
| <b>Fuel enrichment (Pu %)</b>          | <b>21/28</b> | <b>23/31</b>            |
| <b>Fraction of core<br/>discharged</b> | <b>1/3</b>   | <b>1/4</b>              |
| <b>Peak burnup (GWd/t)</b>             | <b>100</b>   | <b>200</b>              |

# **SPECIFIC INNOVATIVE DESIGN FEATURES**

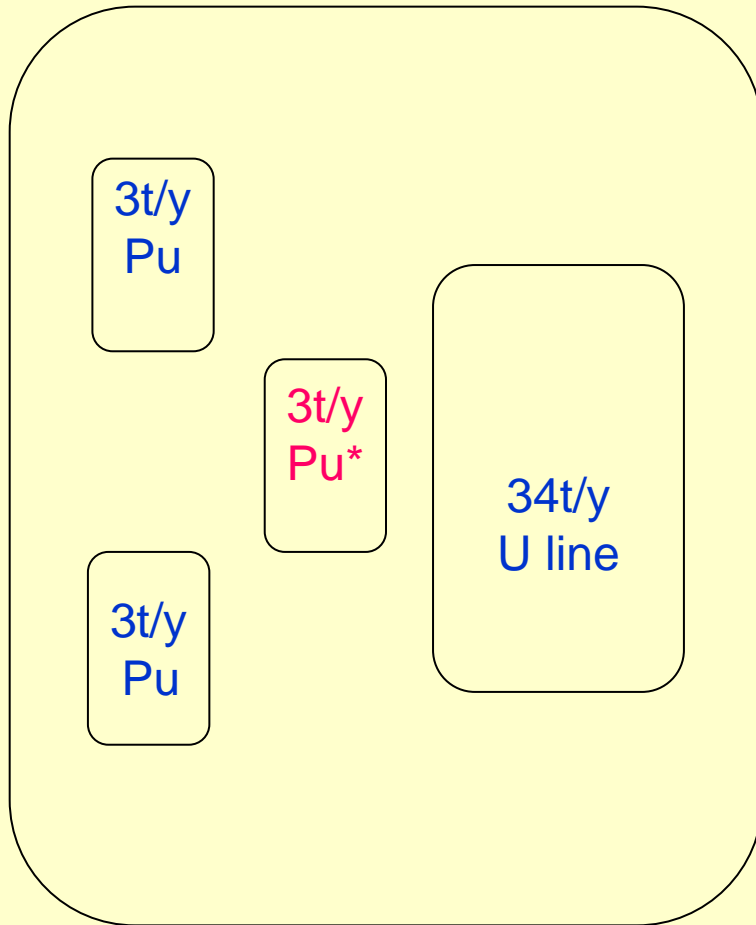

- **Innovative shield materials - reduction of incore shielding cost**
- **Four instead of two inlet pipes from primary pump header to grid plate – reduction of grid plate height**
- **Bean shaped IHX to reduce vessel diameter**
- **Machining of annular gaps to reduce complementary shields**
- **Design of single rotating plug with retractable control plug**

# **CO-LOCATED FUEL CYCLE FACILITIES FOR MULTIPLE UNITS**

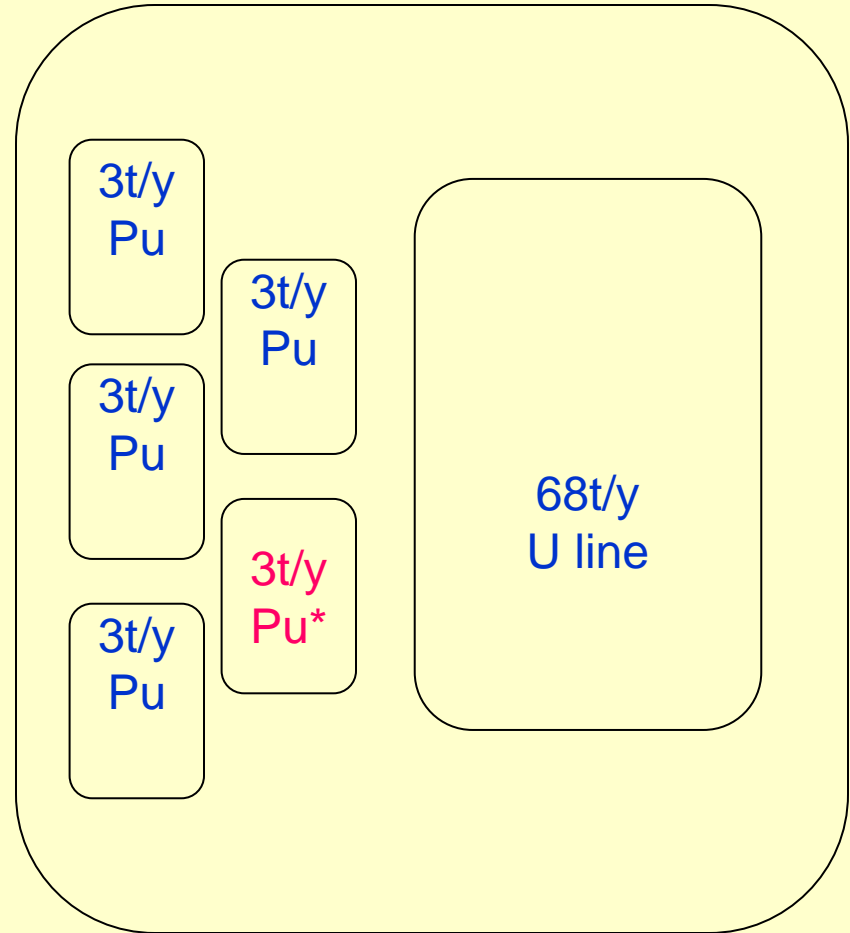

- **Co-located fuel cycle facilities provide**
  - (a) higher physical protection**
  - (b) favourable economics**
  - (c) proliferation resistance (eg. co- processing of U Pu and MA)**
  
- **In a 4 x 1 GWe fuel cycle facility compared to 2 x 1 GWe facility, it is found that per GWe**
  - (a) capital cost is 30 % lower**
  - (b) operation and maintenance is 10 % lower**

# COMPARISON OF FUEL CYCLE PARKS

2 x 1 GWe

4 x 1 GWe

\*stand by

# CONCLUSIONS (1)

- **India is committed to FBR technology for sustaining nuclear power growth as PHWR power programme is limited**
- **Emphasis on multi-disciplinary & inter-disciplinary research and human resource**
- **PFBR under construction at Kalpakkam**
- **In-core fuel management planned using well validated computer codes**

## **CONCLUSIONS (2)**

- **Need to shift to high breeding metallic fuels to achieve significant nuclear power growth**
- **Studies show that despite higher Na void reactivity effect, metal FBR core is safe under ULOFA**
- **Studies on fissile and fertile material balances conducted in co-operation with IAEA show that with Pu from PHWR as input, it is possible to sustain high growth rate of metal fuelled FBR**

## CONCLUSIONS (3)

- **Valuable fission products like radio active Cs, Sr as well as platinum group metal Rh, Ru and Pd can be extracted from FBR fuel cycle for societal applications**
- **With some design changes, MA burner FBR fuel cycle along with Th utilisation possible**

## **CONCLUSIONS (4)**

- **COST REDUCTION OF FUEL CYCLE**
  - (a) Multiple units at same site, enhanced design life and higher fuel burnups**
  - (b) Specific innovative features for next FBRs**
  - (c) Co-located fuel cycle facilities provide higher physical protection, favourable economics and proliferation resistance**

**THANK YOU**
